

Assignment 3:

Problem Statement:

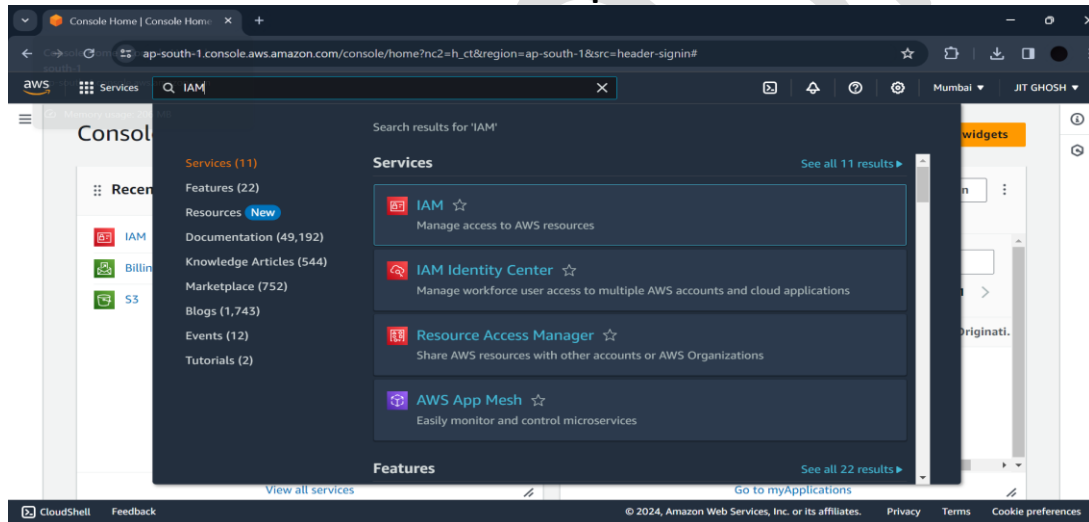

Create IAM user and give full access to S3.

ANSWER:

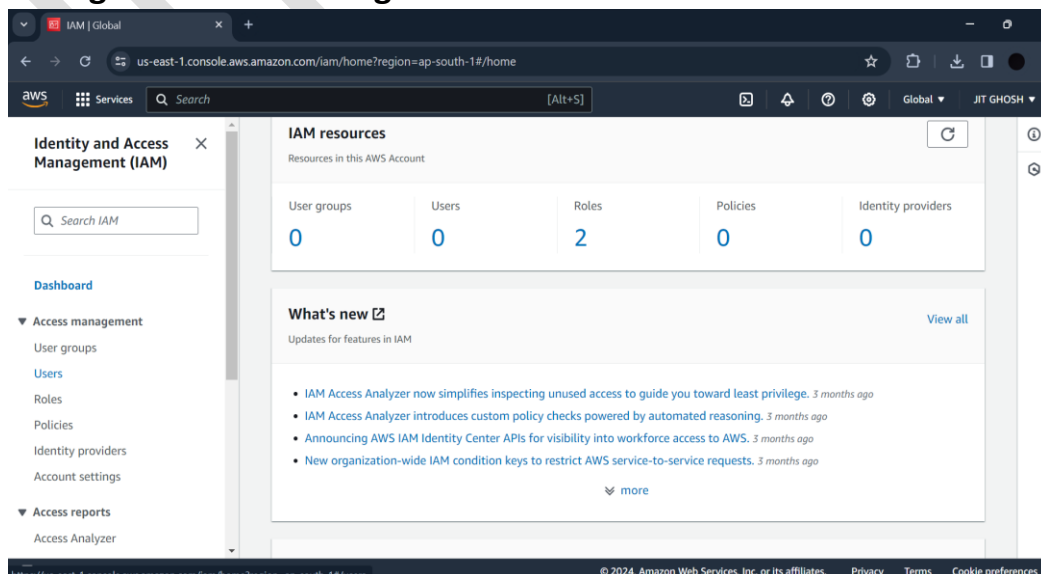

➤ Steps:

Still now we were using Root user which has full control. It is like project manager and IAM (Identity and Access Management) users are like team members. They must be assigned with one or more than one tasks. If IAM is given full access with S3(Simple Storage Services) then it cannot access EC2(Elastic Compute Cloud) or RDS (Relational Database Service). So, the steps of this assignment are: -

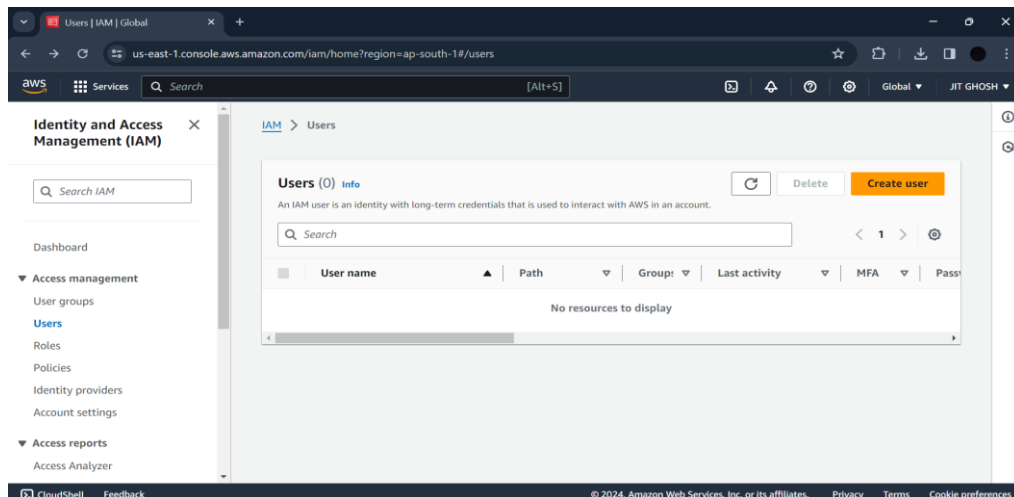

1. At first search IAM and click on IAM option.

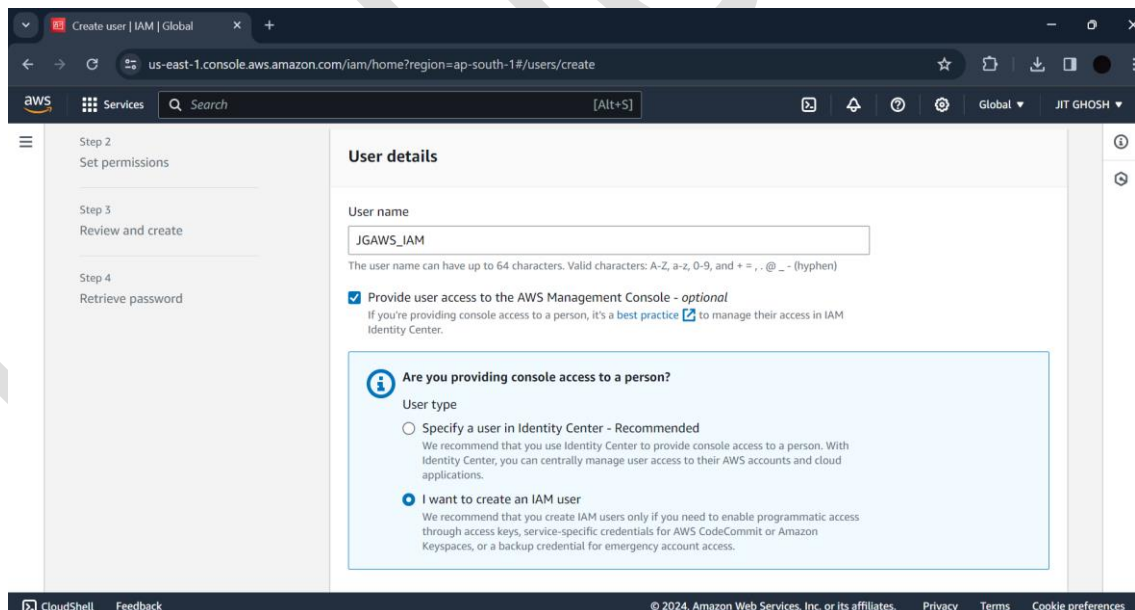

2. Now go to Access management and click on Users.

3. Now Click on Create user.

4. Now give username and click on check box stating 'Provide user access to the AWS Management Console – optional'. After that click on I want to create an IAM user.

5. Now click on Custom password and give password following the rules mentioned bellow and now uncheck the option stating Users must create a new password at next sign-in – Recommended. Now click on next option.

us-east-1.console.aws.amazon.com/iam/home?region=ap-south-1#/users/create

Console password

☐ Autogenerated password
You can view the password after you create the user.

☒ Custom password
Enter a custom password for the user.

- Must be at least 8 characters long
- Must include at least three of the following mix of character types: uppercase letters (A-Z), lowercase letters (a-z), numbers (0-9), and symbols ! @ # \$ % ^ & * () _ + - (hyphen) = [] { } ' "

☐ Show password

☒ Users must create a new password at next sign-in - Recommended
Users automatically get the [IAMUserChangePassword](#) policy to allow them to change their own password.

Info If you are creating programmatic access through access keys or service-specific credentials for AWS CodeCommit or Amazon Keyspaces, you can generate them after you create this IAM user. [Learn more](#)

Cancel Next

6. Now click on Create group.

us-east-1.console.aws.amazon.com/iam/home?region=ap-south-1#/users/create

Step 3
Review and create

Step 4
Retrieve password

Permissions options

☒ Add user to group
Add user to an existing group, or create a new group. We recommend using groups to manage user permissions by job function.

☐ Copy permissions
Copy all group memberships, attached managed policies, and inline policies from an existing user.

☐ Attach policies directly
Attach a managed policy directly to a user. As a best practice, we recommend attaching policies to a group instead. Then, add the user to the appropriate group.

Info Get started with groups
Create a group and select policies to attach to the group. We recommend using groups to manage user permissions by job function, AWS service access, or custom permissions. [Learn more](#)

Create group

► Set permissions boundary - optional

Cancel Previous Next

7. Now give username for user group.

Create user group

Create a user group and select policies to attach to the group. We recommend using groups to manage user permissions by job function, AWS service access, or custom permissions. [Learn more](#)

User group name
Enter a meaningful name to identify this group.

Maximum 128 characters. Use alphanumeric and '+', '@', '-' characters.

Permissions policies (912)

Filter by Type
All types

<input type="checkbox"/>	Policy name	Type	Use...	Description
<input type="checkbox"/>	AdministratorAccess	AWS managed ...	None	Provides full access to AWS services
<input type="checkbox"/>	AdministratorAccess	AWS managed	None	Grants account administrative permissions

Cancel Create user group

8. After this in Permissions policies search S3fullaccess. Click on the [AmazonS3FullAccess](#) checkbox and now click on Create user group.

Create user group

Create a user group and select policies to attach to the group. We recommend using groups to manage user permissions by job function, AWS service access, or custom permissions. [Learn more](#)

User group name
Enter a meaningful name to identify this group.

Maximum 128 characters. Use alphanumeric and '+', '@', '-' characters.

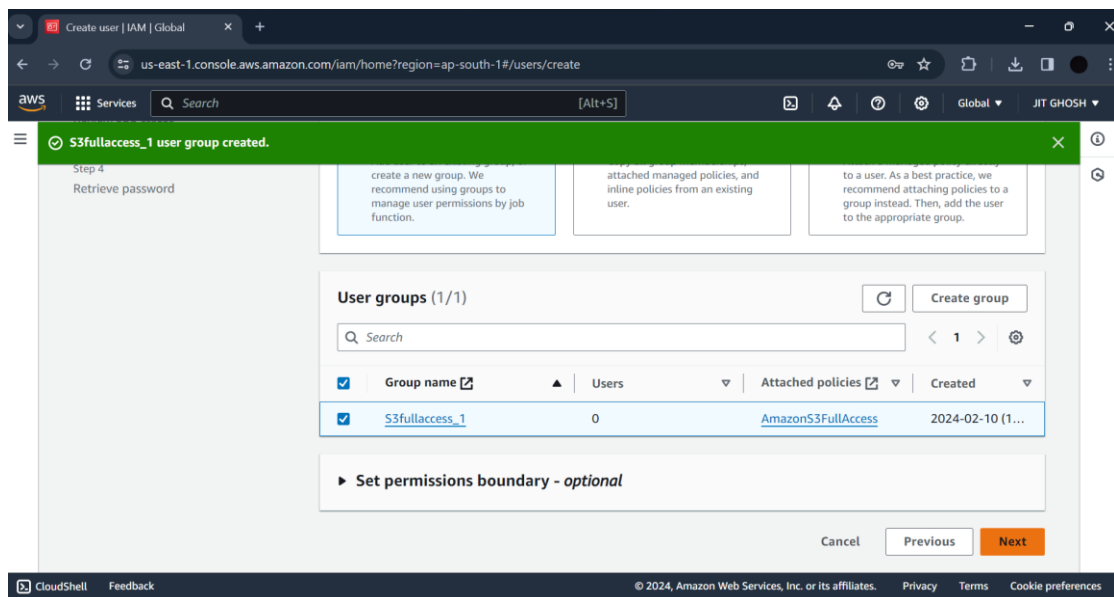

Permissions policies (1/912)

Filter by Type
All types 1 match

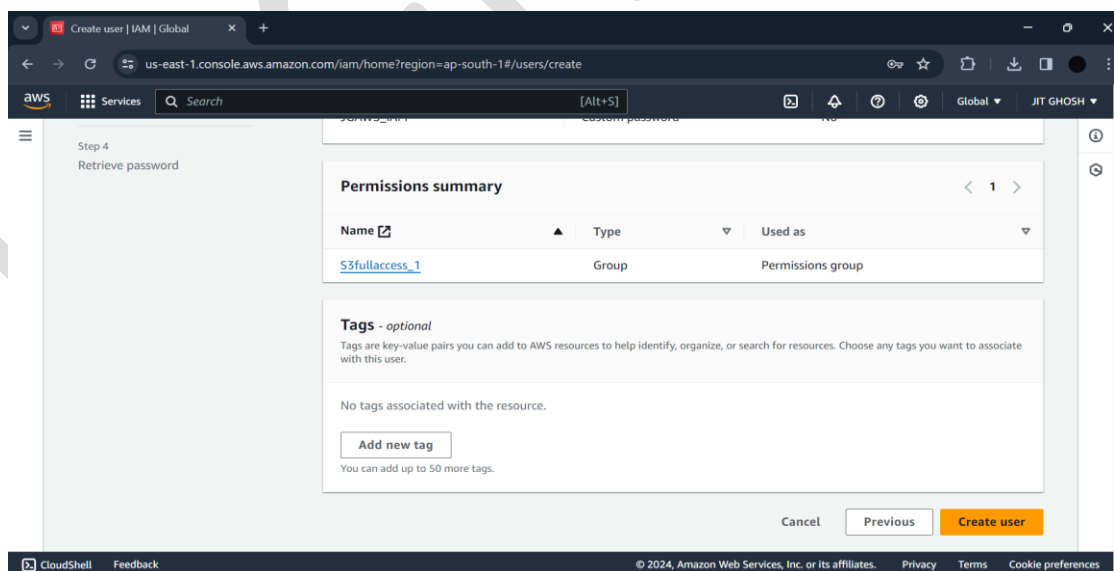

<input checked="" type="checkbox"/>	Policy name	Type	Use...	Description
<input checked="" type="checkbox"/>	AmazonS3FullAccess	AWS managed	None	Provides full access to all buckets v

Cancel Create user group

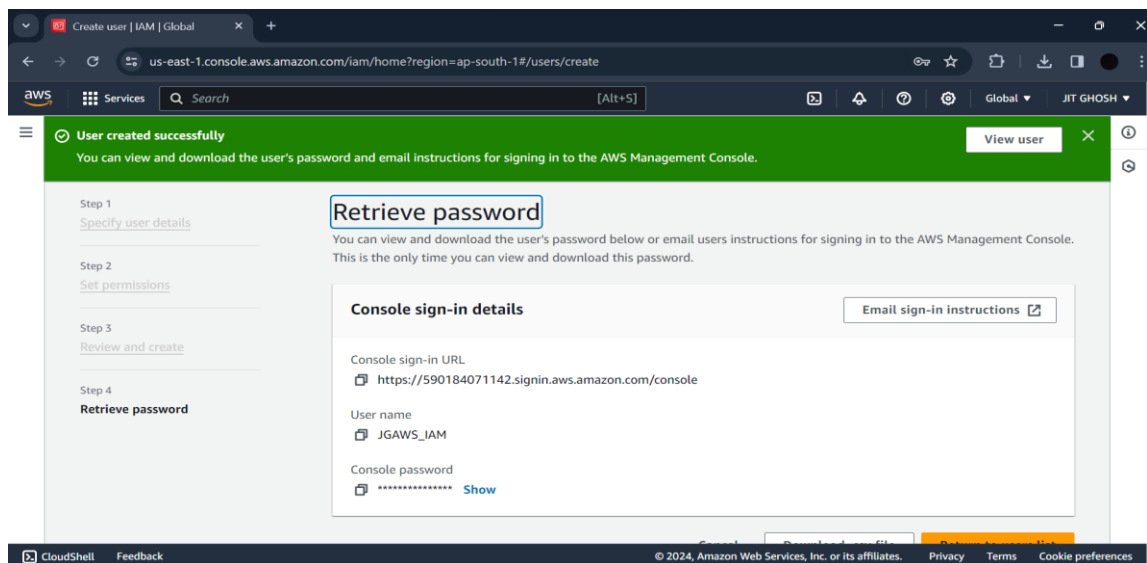

9. After it our first user group will be created. Now click on Group name's checkbox and then click on Next.

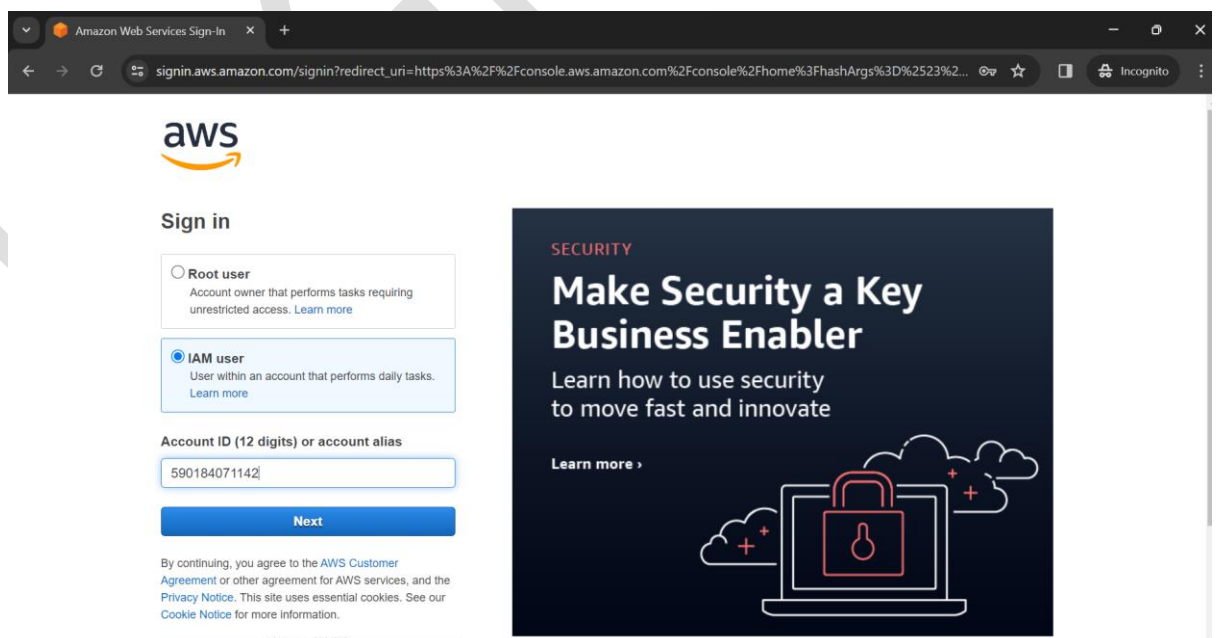

10. Now again click on Create user.

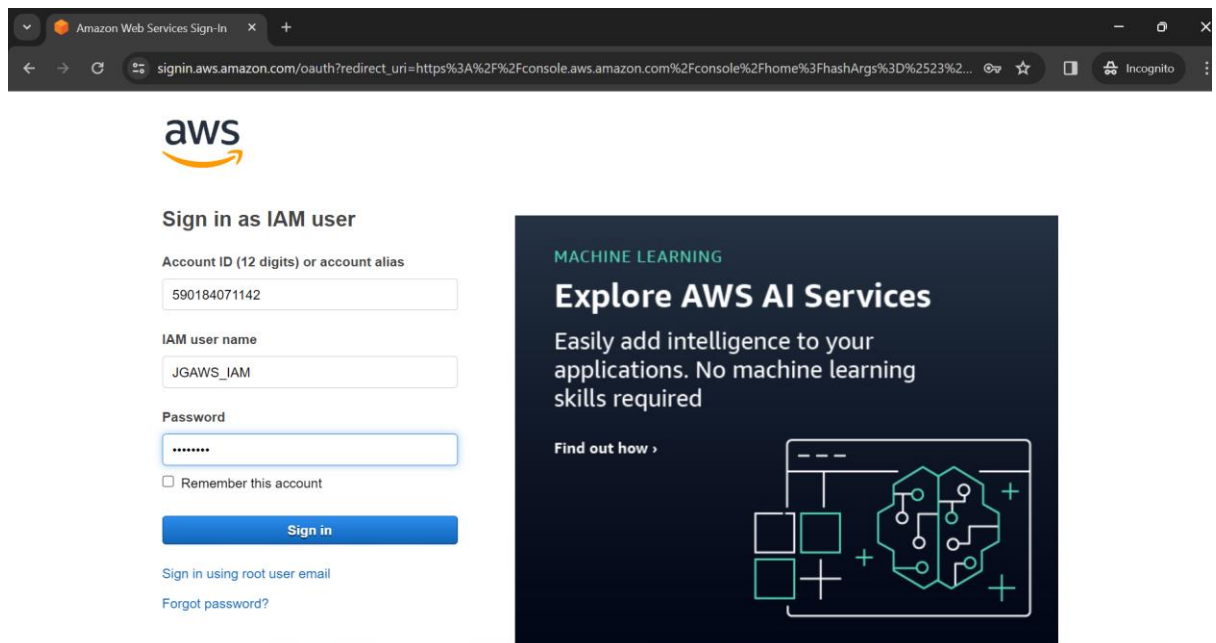

11. Now user will be created successfully. Now download .csv file and click on Return on user list.

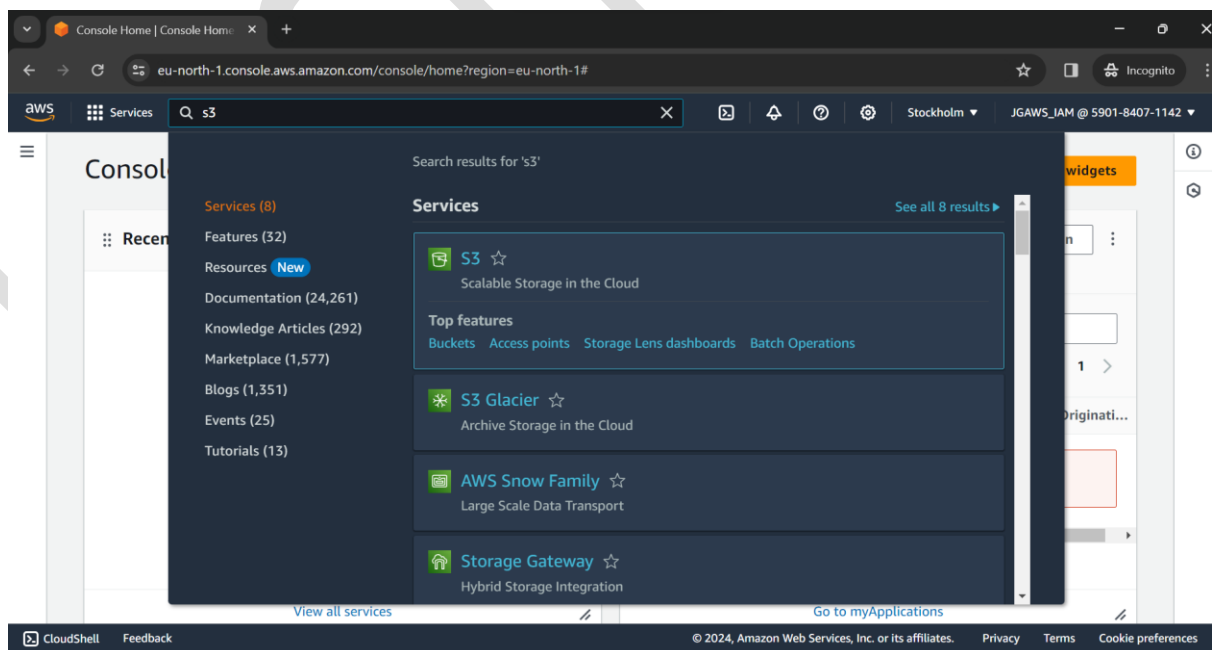

12. Now go to incognito mode and search amazon console login. Click on IAM user and give 12-digit Account ID from that .csv file. Click on Next.

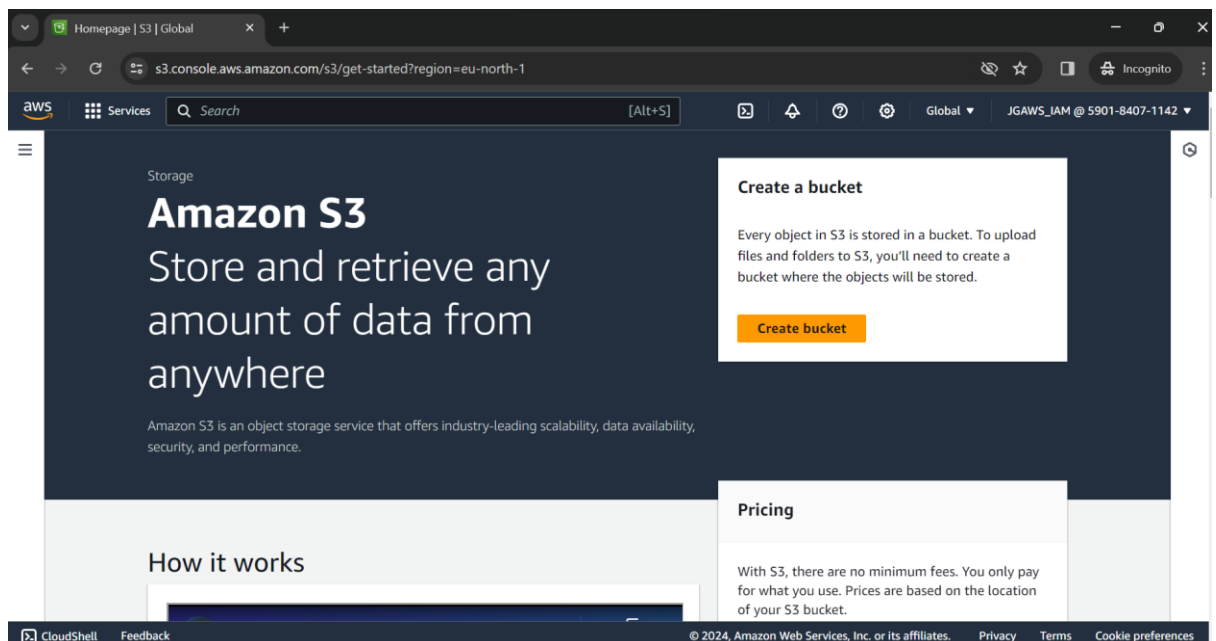

13. Now give IAM user name and Password from that .csv file. Click on sign in.

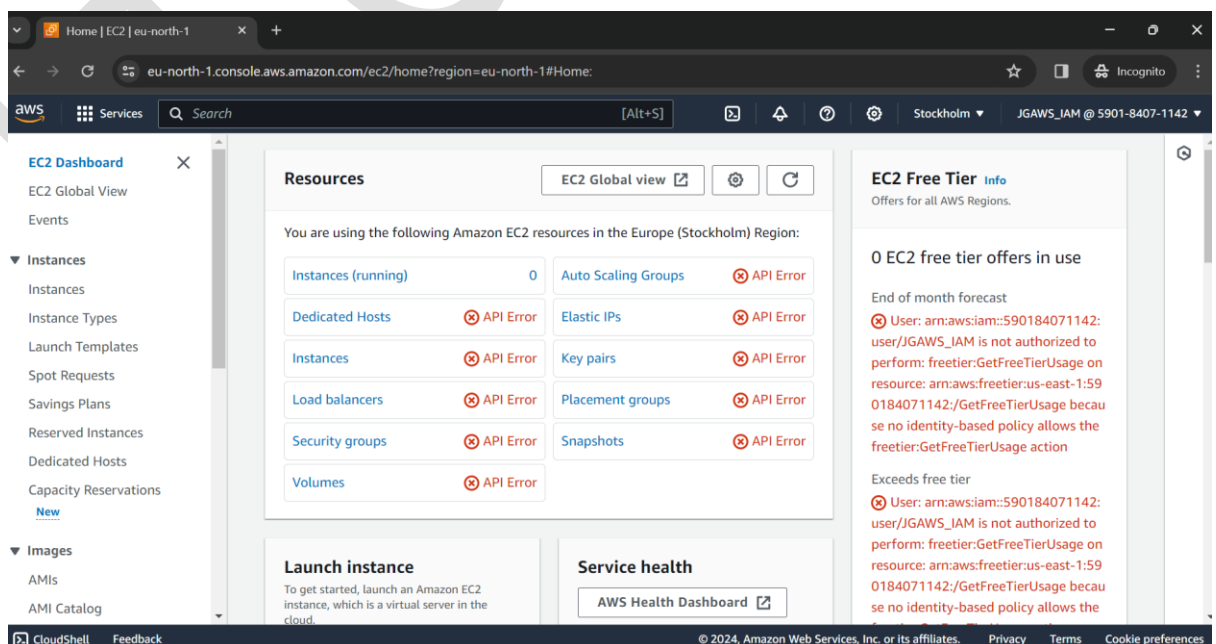

14. Now search S3 in aws console and click in S3.

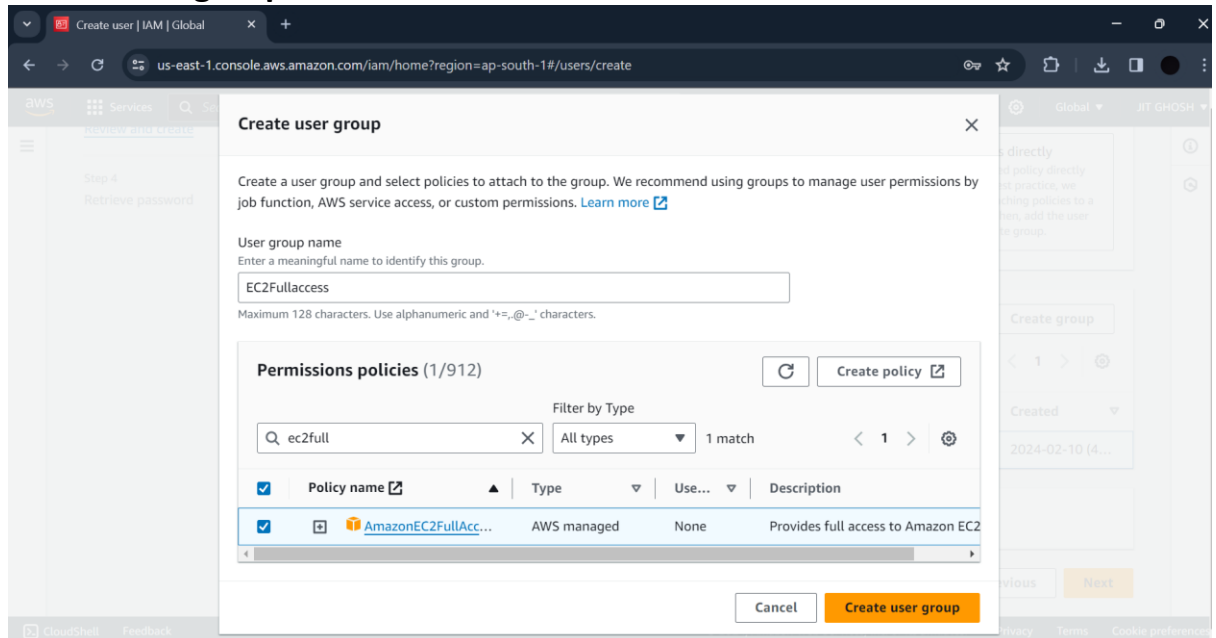

15.S3 window will be opened and there is a option of Create bucket. In this bucket we can apply static website, file, folder.

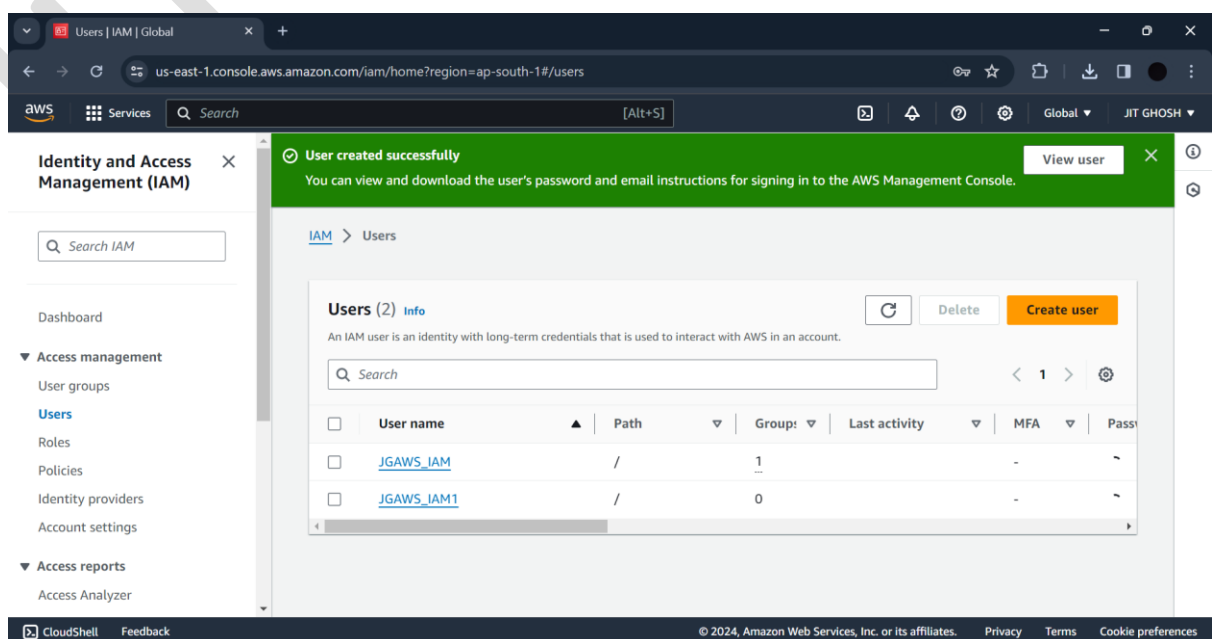

16.Now back to console and search EC2 like S3 and press on EC2. You can see API errors are occurring as only s3 access was given to this user not EC2.

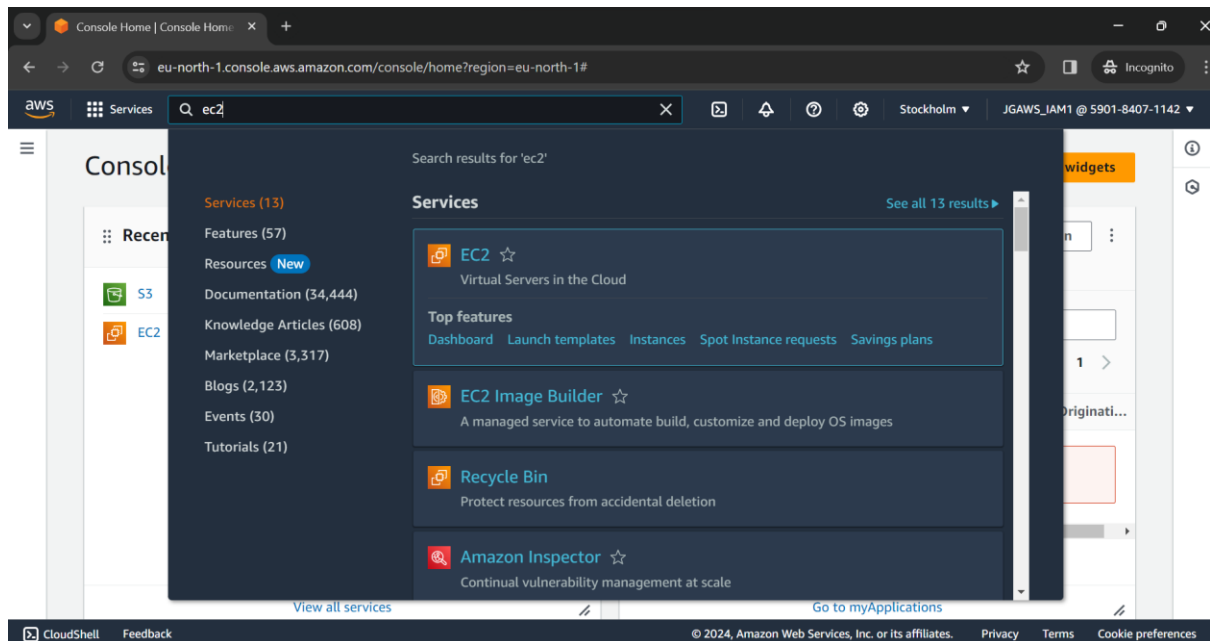

17. Now sign out from IAM account and go to your root account which is also open in other hand. Now make another user. Follow same steps as S3 and make a new user group. And now in Permission policies search EC2 in search bar and click on AmazonEC2FullAccess and press on Create user group.

18. In same way download .csv file and return to users list. Now two separate IAM users will be created and both assigned with different access one is for s3 and another is for EC2.

19. Now in the same way return back to incognito mode and sign in to aws console and select IAM root and give 12 digit id ,username and password by copying those from .csv file like previous. Now search ec2 and click on EC2.

20. Now when we go to EC2 then we can see no API Error is occurring like previous as this user has given access of EC2.
